

Module 6: Video 8 Transcript, Multisensory Learning

Why Do We Need Multisensory Rooms?

Colour

These days we'll often use ivory rather than white simply because it doesn't show the hand prints.

And instead of a black wall we often use blue, which is a much friendlier colour.

These colour contrasts in the room, three ivory walls and one dark blue wall are good for learners who have a visual loss. The colours can also help a person with autism gain spatial awareness.
